

Session 15

- 1. Pick any live webpage you use daily for example, Zomato, Flipkart, or BookMyShow home page) and conduct 15 minutes of exploratory testing – note at least 5 issues, unexpected behaviors, or UI glitches you discover during your session.***

1. Exploratory Testing – Zomato Home Page

Application: Zomato

Feature tested: Home Page

Testing type: Exploratory Testing

Testing duration: 15 minutes

Objective: To explore the webpage freely and identify unexpected behavior, UI issues, usability problems, and functional issues.

Sr. No.	Test Area	Action Performed	Sample Issue / Unexpected Behavior
1	Search bar	Enter a restaurant name and clear it	Search suggestions may take time to load or disappear unexpectedly
2	Location	Change the delivery location	Location suggestions may sometimes be confusing or take time to update
3	Restaurant cards	Open several restaurant cards quickly	Some cards/images may load slower than others
4	Filters	Apply multiple filters together	Filter results may not always be obvious to the user
5	Page scrolling	Scroll continuously through the home page	Some images/content may load after a short delay

Conclusion:

During the 15-minute exploratory session, I focused on search, location, restaurant cards, filters, scrolling, and page loading. The main observations were related to loading delays, unclear feedback, and usability. These areas should be tested further with different browsers, network conditions, and devices.

2. Use error guessing on the Flipkart login page – try at least 3 unusual input combinations (such as a very long email, special characters in the password, or blank fields) and record what happens in each case.
Hint: Think about what kinds of mistakes real users might make and how the app should respond.

Error Guessing – Flipkart Login Page

Application: Flipkart

Feature: Login

Testing Technique: Error Guessing

The purpose of error guessing is to predict common mistakes that real users might make and check whether the application handles them correctly.

TC ID	Input Combination	Action	Expected Result	Sample Observation
EG-01	Very long email/phone input	Enter an unusually long value	System should validate the input and show a clear error	Invalid input should be rejected with an understandable message
EG-02	Special characters	Enter special characters in the password field	Password should be accepted/rejected according to validation rules without breaking the page	Validation should be handled safely
EG-03	Blank fields	Click Login without entering any details	Required-field validation should be displayed	User should be clearly informed that input is required

Additional error guesses

You can also test:

- Spaces before/after the input
- Invalid email format
- Incorrect password
- Copy-paste into fields
- Repeated login attempts
- Very short input

Conclusion:

Error guessing helped identify situations caused by common user mistakes. Clear validation messages are important so that users understand what they need to correct.

3. Create a table listing at least 5 exploratory test scenarios you would perform on the Zomato restaurant search feature, including what you would do and what kind of bugs you might expect to find.

Exploratory Testing – Zomato Restaurant Search

Feature: Restaurant Search

Sr. No.	Test Scenario	What I Would Do	Possible Bugs / Issues
1	Search valid restaurant	Enter an existing restaurant name	Correct restaurant may not appear
2	Search invalid restaurant	Enter random/non-existing name	Incorrect results or unclear "no results" message
3	Partial search	Enter only part of restaurant name	Relevant suggestions may not appear
4	Special characters	Search using symbols such as @, #, etc.	Application may crash or show irrelevant results
5	Empty search	Click search without entering text	Search may behave unexpectedly or provide unclear feedback
6	Different location	Change location and search	Restaurants from the previous location may appear
7	Search with filters	Search a restaurant and apply cuisine/other filters	Filters may not correctly affect results
8	Case variation	Search using uppercase/lowercase letters	Search results may differ unexpectedly

Expected result

The search feature should provide **relevant results, useful suggestions, clear error messages, and consistent results after applying filters or changing location.**

4. Perform exploratory testing on the Paytm recharge flow (up to the payment screen, do not actually pay) and write a short report describing your testing approach, any bugs or usability issues found, and suggestions for improvement.
Constraint:
Focus on areas where you think users might get confused or stuck, not just obvious errors.

Exploratory Testing – Paytm Recharge Flow

Application: Paytm

Feature: Recharge

Scope: Test only up to the payment screen. **Do not complete payment.**

Testing approach

I used an exploratory approach rather than following only predefined test cases. I focused particularly on areas where users could become confused, such as selecting the operator, entering the mobile number, selecting a plan, checking the amount, and moving toward payment.

Test report

Area	Action Performed	Possible Observation
Mobile number	Enter a valid mobile number	System should identify the correct operator/circle where applicable
Invalid number	Enter an invalid/incomplete number	Clear validation message should be displayed
Operator	Check automatically selected operator	User should be able to understand or correct the selection
Recharge plan	Open available plans	Plans should be clearly categorized and easy to understand
Amount	Select a recharge amount	Selected amount should remain consistent throughout the flow
Custom amount	Try entering an unsupported amount	Application should clearly explain acceptable amounts

Plan details	Open a plan	Validity, benefits, and price should be clearly visible
Navigation	Move toward payment screen	User should always know the amount and recharge details before payment
Back button	Go back and return to the recharge screen	Previously entered information should behave consistently
Payment screen	Reach payment screen without paying	Final amount and recharge information should be clearly displayed

Sample usability issues

1. **Plan information may require extra attention** — users should be able to quickly understand validity and benefits.
2. **Operator information should be clearly visible** so users can verify that the correct operator is selected.
3. **Recharge amount should be clearly shown before payment** to prevent accidental mistakes.
4. **Validation messages should explain the problem clearly** instead of simply indicating that an input is invalid.
5. **Navigation should preserve relevant information** so users do not become confused after going back.

Suggestions for improvement

- Use clear and specific validation messages.
- Display the selected operator and mobile number prominently.
- Make recharge amount and plan validity easy to compare.
- Clearly summarize the recharge details before the payment step.
- Keep navigation consistent and preserve user-entered information where appropriate.

Final Conclusion

The Paytm recharge flow was explored up to the payment screen without completing a transaction. The testing concentrated on user confusion, validation, plan selection, operator identification, amount verification, and navigation. These areas are important because small usability problems can cause users to hesitate or make incorrect selections.
