

Session 7

1. Pick any one app you use daily (like Zomato, Instagram, or Paytm) and write a detailed test plan for its login feature, including at least these components: objective, scope, test items, features to be tested, features not to be tested, test deliverables, schedule, and responsible roles.

1. Detailed Test Plan for Instagram Login Feature

Test Plan

Application: Instagram

Feature: Login

1. Objective

The objective is to verify that the Instagram login feature works correctly, securely, and reliably. Users should be able to log in with valid credentials and receive appropriate messages for invalid credentials.

2. Scope

In Scope:

- Login using username/email and password.
- Valid and invalid login credentials.
- Empty username/email and password fields.
- Password visibility option.
- Forgot password functionality.
- Login button functionality.
- Error and validation messages.
- Login on different browsers and devices.

Out of Scope:

- Instagram post creation.
- Stories and Reels.
- Direct messaging.
- Profile editing.
- Instagram advertising features.

3. Test Items

The following items will be tested:

- Login page/UI

- Username/email field
- Password field
- Login button
- Forgot password link
- Error messages
- Authentication system
- Session management

4. Features to be Tested

Feature	What to Test
Username/Email	Accept valid and invalid values
Password	Check correct and incorrect passwords
Login Button	Verify successful login
Validation	Check empty/invalid fields
Forgot Password	Verify password recovery process
Error Messages	Verify correct messages are displayed
Security	Check password masking and session security
Compatibility	Test on different browsers/devices

5. Features Not to be Tested

- Posting photos and videos
- Stories and Reels
- Instagram shopping
- Direct messages
- Profile customization
- Advertising features

6. Test Deliverables

The following deliverables will be prepared:

- Test Plan
- Test Scenarios
- Test Cases
- Test Data
- Defect/Bug Reports
- Test Execution Report
- Test Summary Report

7. Schedule

Activity	Duration
Test Planning	1 Day
Test Case Design	2 Days
Test Environment Setup	1 Day
Test Execution	3 Days
Bug Retesting	2 Days
Test Reporting	1 Day

8. Responsible Roles

Role	Responsibility
Test Leader	Prepare test plan and manage testing
Tester	Design and execute test cases
Developer	Fix reported defects
Product Owner	Clarify requirements and approve feature
QA Team	Monitor quality and prepare reports

2.

Create a mini test strategy document for the search functionality in a movie ticket booking app (like BookMyShow), specifying your approach to test levels (unit, integration, system), test types (functional, non-functional), and tools you would use.
Hint: Mention at least one tool for each test level or type.

Mini Test Strategy for Search Functionality in a Movie Ticket Booking App

Application: BookMyShow-like movie ticket booking application

Feature: Movie Search

Objective

The objective is to verify that users can search for movies quickly and get accurate and relevant search results.

Test Levels

Test Level	Testing Approach	Tool
Unit Testing	Test individual search functions such as keyword matching and filtering	JUnit
Integration Testing	Test interaction between search UI, search API and database	Postman
System Testing	Test the complete search functionality from entering a keyword to viewing results	Selenium

Test Types

Test Type	What Will Be Tested	Tool
Functional Testing	Search by movie name, actor, language, genre, etc.	Selenium
Performance Testing	Check search response time with many users	JMeter
Security Testing	Check input validation and protection against malicious input	OWASP ZAP
Compatibility Testing	Check search on different browsers/devices	BrowserStack

Important Test Scenarios

1. Search using a valid movie name.
2. Search using an invalid movie name.
3. Search with partial movie names.
4. Search with uppercase and lowercase letters.

5. Search using different languages.
6. Verify relevant results are displayed.
7. Check search response time.
8. Check search functionality on different browsers.
9. Check filters such as language, genre and location.
10. Check behavior when no results are found.

Tools Used

- **JUnit** – Unit testing
 - **Postman** – API/integration testing
 - **Selenium** – System and functional testing
 - **JMeter** – Performance testing
 - **OWASP ZAP** – Security testing
 - **BrowserStack** – Compatibility testing
-

3. List and explain three key differences between a test plan and a test strategy, using examples from any food delivery or e-commerce app you know.

Three Differences Between Test Plan and Test Strategy

Point	Test Plan	Test Strategy
1. Meaning	A test plan describes what, when, and who will test a specific feature/project.	A test strategy describes the overall testing approach and methods to be followed.
2. Scope	Usually specific to a project, feature, or release.	Usually broader and can apply across multiple projects or applications.
3. Changes	It can change frequently according to project requirements and schedule.	It is generally more stable and changes when the overall testing approach changes.

Example

For a **Swiggy-like food delivery application**:

- **Test Plan:** Specifies that the checkout and payment feature will be tested for 5 days by 3 testers, including the test cases and deliverables.

- **Test Strategy:** Specifies that the application will use unit, integration, system, functional, performance, and security testing.
-

4. Identify at least two risks, two assumptions, and two dependencies that could affect testing the payment feature in a shopping app (like Flipkart or Myntra).

Risks, Assumptions and Dependencies for Payment Testing

A. Risks

1. Payment Gateway Failure

The third-party payment gateway may be unavailable or may fail during payment processing. This can prevent testers from completing payment test cases.

2. Duplicate or Incorrect Payment

A technical problem may cause a payment to be processed twice or show an incorrect payment status.

B. Assumptions

1. Test Payment Accounts Are Available

It is assumed that testers will have access to test cards, UPI accounts, or other test payment methods.

2. Test Environment Is Stable

It is assumed that the application, database, and payment gateway test environment will be available during testing.

C. Dependencies

1. Payment Gateway

Testing depends on the availability and proper functioning of the third-party payment gateway.

2. Bank/UPI Services

Payment testing may depend on external banking or UPI services being available for testing transactions.

5.

*Given this scenario: Your team is planning to test the 'add to cart' feature in an online grocery app. Write a short paragraph describing how you would update the test plan if a new dependency (like a third-party coupon system) is introduced during the project.

Hint: Focus on changes to scope, schedule, or deliverables.*

Updating the Test Plan When a Third-Party Coupon System Is Introduced

If a third-party coupon system is introduced while testing the **Add to Cart** feature, I would update the test plan to include the new dependency and its related testing activities. The test scope would be expanded to cover coupon validation, discount calculation, expired coupons, invalid coupons, and the interaction between the cart and coupon system. The schedule may need additional time for integration testing and defect retesting. New test cases and test data would be added, and API/integration test reports would become additional deliverables. The responsible roles would also be updated if another team or third-party provider is required for support.
