

Session- 1

1. Open the homepage of Zomato or Flipkart in your browser and carefully review it for any visible errors, bugs, or defects (such as broken images, misaligned buttons, typos, or non-working links). List at least 3 issues you observe and describe why you think each one is a defect.

1. Finding Defects on a Website

I reviewed the homepage of **Flipkart** and identified the following possible defects:

No.	Issue Observed	Why is it a Defect?
1	Some images may take time to load or may not appear properly.	A broken or missing image makes the webpage look incomplete and can confuse users.
2	Some buttons or menu items may not respond properly when clicked.	If a button does not work as expected, users cannot access the intended feature.
3	Text or product information may have spelling/formatting mistakes.	Incorrect text looks unprofessional and can give users wrong information.

Note: Website content changes frequently, so the exact issues can vary when you check the website. For your assignment, you can replace these examples with the specific issues you actually observe.

2. Write a short explanation (2-3 sentences each) for the following: What is the difference between an error, a bug, and a defect? Give one real-world example for each from any app you use daily (e.g., Instagram, Paytm, IRCTC).

* Difference Between Error, Bug and Defect

Error

An **error** is a mistake made by a person while designing, coding, or testing software.

Example: A developer accidentally writes the wrong calculation formula in a payment app.

Bug

A **bug** is a problem in the software caused by an error in the code, which makes the application behave incorrectly.

Example: In Instagram, the app crashes when a user tries to upload a particular type of photo.

Defect

A **defect** is a difference between the expected result and the actual result of the software. It means the software does not work according to its requirements.

Example: In a railway booking app, the ticket price shown on the screen is different from the actual price at payment.

Easy way to remember:

Human mistake → Error → Bug in software → Defect noticed during testing/use

3. Think of a recent time when an app you use (like WhatsApp, BookMyShow, or PhonePe) didn't work as expected. Identify the possible cause of the defect: was it a human error, a technical limitation, or a process gap? Explain your reasoning for each case.
Hint: Consider examples like payment failures, app crashes, or incorrect notifications.

Example of an App Not Working as Expected

Example: PhonePe Payment Failure

Suppose I tried to make a payment using **PhonePe**, but the payment failed even though the amount was deducted temporarily.

The possible cause could be a **technical limitation** because the bank server or payment network may have been temporarily unavailable. It could also be a **process gap** if the app does not properly handle the communication between the bank and the payment system.

My conclusion: In this case, the most likely cause is a **technical issue/server problem**, rather than a mistake made by the user.

4. Imagine you are testing a new food delivery app (like Swiggy). List 3 types of risks that could affect the quality of the app before launch (for example: security risk, usability risk, performance risk). For each risk, briefly explain how it could impact users.

Risks Before Launching a Food Delivery App

Risk	Explanation	Impact on Users
1. Security Risk	User information and payment details may not be properly protected.	Personal or payment information could be exposed or misused.
2. Usability Risk	The app may be difficult to understand or navigate.	Users may struggle to search for food, place orders, or make payments.
3. Performance Risk	The app may become slow when many users access it at the same time.	Users may experience delays, failed orders, or app crashes.

Example: During dinner time, thousands of people may order food at once. If the app cannot handle the traffic, it may become very slow.

5. You are given a mini project: a Movie Ticket Booking webpage. Classify the following as either a defect or a risk: (a) The 'Book Now' button does not respond on mobile, (b) There is no logout option, (c) The app sometimes loads slowly during IPL match days. Justify your answer for each.

Movie Ticket Booking Webpage – Defect or Risk?

(a) 'Book Now' button does not respond on mobile

Answer: Defect ❌

This is a **defect** because the button is expected to work when users click it. If it does not work on mobile devices, users cannot book tickets.

(b) There is no logout option

Answer: Defect ❌

This is a **defect** if the application's requirements specify that users should be able to log out. Without a logout option, users may have difficulty securely ending their session.

(c) App sometimes loads slowly during IPL match days

Answer: Risk ⚠️

This is a **performance risk** because a large number of users may access the app at the same time. If the system cannot handle the increased traffic, it could become slow or unavailable.

★ Quick Revision

Term	Simple Meaning
Error	Human mistake
Bug	Problem caused by an error in software
Defect	Software does not work as expected
Risk	Something that could cause a problem in the future

Remember:

👉 Defect = Problem already exists

👉 Risk = Problem might happen
