

Session 2

1. List 3 key responsibilities each for a Tester and a Test Leader in a software project, and give one example of how each role contributes during a release cycle.

1. Responsibilities of a Tester and Test Leader

Tester – 3 Key Responsibilities

1. **Create and execute test cases:**
A tester prepares test cases based on the requirements and checks whether the software works as expected.
2. **Find and report defects:**
The tester identifies bugs during testing and reports them clearly to the development team with steps to reproduce them.
3. **Perform different types of testing:**
A tester may perform functional, regression, integration, usability, and other required tests to ensure the product is working correctly.

Example during a release:

Before an online shopping app is released, the tester checks features such as login, product search, add-to-cart, payment, and order confirmation. Any problems found are reported and retested after developers fix them.

Test Leader – 3 Key Responsibilities

1. **Prepare the testing strategy and plan:**
The Test Leader decides what needs to be tested, how it will be tested, and what resources are required.
2. **Manage the testing team:**
The Test Leader assigns tasks to testers, monitors their progress, and helps resolve testing-related problems.
3. **Track testing status and release readiness:**
The Test Leader reviews defect reports, test results, and remaining risks and communicates the testing status to project stakeholders.

Example during a release:

Before releasing a food delivery app update, the Test Leader checks whether all important test cases have been completed, critical defects are fixed, and the application is ready for release.

**2 . Pick any app you use daily (Instagram, Zomato, Paytm, etc.) and write a one-paragraph comparison of how Quality Assurance (QA) and Quality Control (QC) would be performed for that app.

Hint:**

Think about activities done before coding vs after coding is complete.

QA vs QC for a Food Delivery App

For a food delivery app such as Swiggy, **Quality Assurance (QA)** focuses mainly on preventing problems before and during development by defining proper processes, reviewing requirements, preparing testing standards, and ensuring developers and testers follow good development practices. **Quality Control (QC)** focuses on finding actual problems in the finished or partially finished application by executing test cases and checking features such as restaurant search, menu selection, promo codes, ordering, payment, and order tracking. In simple words, QA is mainly **process-oriented and preventive**, while QC is mainly **product-oriented and focused on detecting defects**.

3 .Explain the difference between Testing and Debugging by describing what a tester does vs what a developer does when a bug is found in a Flipkart-style shopping cart feature.

Difference Between Testing and Debugging

Testing and **debugging** are different activities. Testing is mainly performed by a tester to **find and report a problem**, while debugging is normally performed by a developer to **find the cause of the problem and fix the code**.

Example: Flipkart-style Shopping Cart

Suppose a customer adds **2 units of a product** to the shopping cart, but the cart displays only **1 unit**.

- **Tester:** The tester performs the test case, notices that the quantity is incorrect, records the expected and actual results, and reports the bug to the developer.
- **Developer:** The developer examines the source code, identifies why the quantity is not being updated correctly, makes the necessary code changes, and tests the fix.
- **Tester after the fix:** The tester tests the shopping cart again to confirm that the problem has been resolved and checks related cart functions to make sure the fix did not create another problem.

In short:

Testing → Finds the defect

Debugging → Finds the cause and fixes the defect

**4 . Create a basic test plan skeleton in a Word or Google Doc for a new feature in a food delivery app (like Swiggy) — include at least these sections: Test Plan ID, Feature Description, Test Scope, Roles & Responsibilities, Test Environment, and Test Deliverables.

Constraint: Do not copy any template from the internet; write each section in your own words for a real food delivery feature (e.g., promo code, order tracking).**

Basic Test Plan – Food Delivery App

You can create this in **Microsoft Word** or **Google Docs** using the following content.

TEST PLAN

Test Plan ID

TP-FD-001

Feature Description

Feature: Promo Code Application

The feature allows customers to enter a valid promotional code while placing a food order. If the code is valid and the order satisfies the required conditions, the appropriate discount should be applied to the order total. The application should also display a suitable message when a promo code is invalid, expired, or not applicable.

Test Scope

In Scope:

- Entering a promo code during checkout.

- Applying a valid promo code.
- Checking discount calculation.
- Testing expired promo codes.
- Testing invalid promo codes.
- Testing minimum-order requirements.
- Checking whether the final payable amount is correct.
- Removing an applied promo code.
- Checking the promo code behavior after changing the cart amount.

Out of Scope:

- Restaurant food preparation.
- Delivery partner assignment.
- Actual restaurant operations.
- Internal payment gateway implementation.

Roles & Responsibilities

Role	Responsibility
Test Leader	Creates the test plan, assigns testing tasks, monitors progress, and reviews final results.
Tester	Creates test cases, executes them, identifies defects, and performs retesting.
Developer	Fixes defects reported by the testing team and provides updated builds.
Product Owner	Confirms that the promo code feature meets business requirements.

Test Environment

The feature will be tested in an environment similar to the real application.

- **Application:** Food delivery mobile/web application
- **Operating Systems:** Windows, Android, and iOS
- **Browsers:** Chrome, Edge, and Safari
- **Database:** Test database containing restaurants, menus, users, and promo codes
- **Network:** Wi-Fi and mobile internet
- **Test Accounts:** Customer accounts with different order histories
- **Test Data:** Valid, invalid, expired, and minimum-order promo codes

Test Deliverables

The following documents and results will be produced during testing:

1. Test Plan
2. Test Scenarios

3. Test Cases
4. Test Data
5. Defect/Bug Reports
6. Test Execution Results
7. Retest Results
8. Regression Testing Results
9. Final Test Summary Report

Expected Result

The promo code feature should correctly apply eligible discounts, reject invalid or expired codes, calculate the final order amount accurately, and provide clear messages to the customer when a code cannot be used.

Suggested assignment heading

At the top of your Word document, you can write:

SOFTWARE TESTING ASSIGNMENT

Name: Ved Khamar

Subject: Software Testing

Assignment: Testing, QA, QC and Test Plan

Date: 4 September 2026

This version is written in original wording and is suitable for submitting as a basic college/school assignment.
