

Session 16

1. Pick any one feature from a popular app you use (like Instagram's post upload, Zomato's order placement, or Flipkart's add to cart) and write 3 test cases you would re-test after a bug fix is made to that feature.

Regression Testing Assignment

1. Re-test cases after a bug fix

Feature Selected: Flipkart – Add to Cart

After a bug fix in the Add to Cart feature, I would re-test these cases:

Test Case ID	Test Scenario	Expected Result
TC01	Select a product and click Add to Cart	Product should be added successfully to the cart
TC02	Add the same product multiple times	Cart should correctly update the product quantity
TC03	Remove the product from the cart	Product should be removed and cart total should update correctly

Purpose: Re-testing confirms that the specific bug has been fixed successfully.

***2. Imagine you are testing the 'Apply Coupon' feature on Swiggy. After a bug related to coupon validation is fixed, design a re-testing checklist with at least 4 steps to confirm the fix works as expected.

Hint: Think about both valid and invalid coupon scenarios.***

Re-testing checklist – Swiggy Apply Coupon

After fixing a coupon validation bug, I would perform the following checks:

Step	Test Scenario	Expected Result
1	Apply a valid coupon when all conditions are satisfied	Coupon should be applied successfully
2	Apply an expired coupon	Coupon should be rejected with an appropriate message
3	Apply an invalid/non-existing coupon code	Coupon should not be applied
4	Apply a valid coupon when the minimum order value is not reached	Coupon should be rejected
5	Apply a valid coupon when the user is not eligible	Coupon should be rejected
6	Remove the applied coupon	Discount should be removed and total amount should update

Conclusion: Both valid and invalid scenarios should be tested to make sure the coupon validation bug is completely fixed.

3. Create a regression test suite for the 'Search' module in a music streaming app (like Spotify). List at least 5 regression test cases that should be run after any update to the search functionality.

Regression Test Suite – Music App Search

Module: Search in Spotify-like Music Streaming App

Test Case ID	Regression Test Case	Expected Result
RT01	Search for a valid song name	Relevant songs should be displayed
RT02	Search for an artist name	Matching artists should be displayed
RT03	Search for an album name	Matching albums should be displayed
RT04	Search using an invalid/non-existing keyword	"No results" or appropriate message should be displayed
RT05	Search using partial keywords	Relevant matching results should be displayed

RT06	Search with blank search field	App should handle the blank search properly
RT07	Select a search result	Correct song/artist/album page should open

These tests should be executed after changes to the Search module to ensure existing functionality has not been broken.

4.Explain why regression testing is especially important in agile development when teams release new features every sprint. Give two examples from any app you use where skipping regression testing could cause old features to break.

Importance of Regression Testing in Agile

Regression testing is very important in **Agile development** because new features and changes are released frequently, usually in every sprint.

A change in one module can accidentally affect an existing feature. Regression testing helps confirm that **old features continue to work after new changes are introduced**.

Example 1 – Zomato:

Suppose a new payment feature is added. If regression testing is skipped, the existing **Add to Cart or Order Placement** feature could stop working correctly.

Example 2 – Instagram:

Suppose Instagram changes its post-upload functionality. Without regression testing, existing features such as **liking posts or commenting** could accidentally be affected.

Therefore, regression testing helps maintain the stability and reliability of the application after every sprint.

***5.Suppose your team just released a new version of a movie ticket booking app (like BookMyShow) with a major update to the payment module. Select 3 modules (other than payment) that could be affected and describe one regression test you would run for each.

Hint: Think about modules like seat***

selection, booking history, or notifications that interact with payment.

Regression Testing after BookMyShow Payment Update

Updated Module: Payment

Three other modules that could be affected are:

Module	Regression Test	Expected Result
1. Seat Selection	Select seats, proceed to payment, and complete a successful booking	Selected seats should remain reserved and booking should be confirmed
2. Booking History	Complete a ticket booking and open Booking History	The new booking should appear with correct movie, seats, date and booking details
3. Notifications	Complete a successful booking and check notification/email/SMS	Booking confirmation notification should be generated with correct details

Final Conclusion

Regression testing ensures that **existing features continue to work correctly after new changes or bug fixes**. It is especially useful in Agile projects because applications are updated frequently through multiple sprints.
