

Session 18

1. Write an end-to-end test scenario for booking a movie ticket on BookMyShow, starting from searching for a movie to completing the payment and receiving a booking confirmation.

1. End-to-End Test Scenario – BookMyShow Movie Booking

Scenario: Verify that a user can successfully book a movie ticket from start to finish.

Step	Test Step	Expected Result
1	Open BookMyShow website/app	Home page should open successfully
2	Search for a movie	Relevant movie should be displayed
3	Select the movie	Movie details should be displayed
4	Select city and theatre	Available theatres should be displayed
5	Select date and show time	Available shows should be displayed
6	Select a show	Seat selection page should open
7	Select available seats	Selected seats should be highlighted
8	Continue to payment	Payment page should open
9	Select payment method	Selected payment option should be displayed
10	Complete payment	Payment should be processed successfully
11	Check booking confirmation	Booking ID/ticket details should be displayed
12	Check SMS/email notification	Booking confirmation should be received

Expected End Result: Movie ticket should be booked successfully and the user should receive a booking confirmation.

2. Create a detailed system integration test scenario for placing a food order on Zomato, covering steps from

selecting a restaurant and adding items to cart, to payment and order tracking.

System Integration Test – Zomato Food Order

Scenario: Verify that different Zomato systems work together correctly when a user places a food order.

Step	Test Step	Integration/System	Expected Result
1	Open Zomato and log in	Login/User System	User should log in successfully
2	Search for a restaurant	Search & Restaurant System	Restaurants should be displayed
3	Select a restaurant	Restaurant/Menu System	Restaurant menu should open
4	Select food items	Menu/Cart System	Items should be added to cart
5	Check cart total	Cart/Pricing System	Correct price and charges should be displayed
6	Enter/select delivery address	Address/Location System	Valid address should be accepted
7	Select payment method	Payment Gateway	Payment option should work
8	Make payment	Zomato/Payment Gateway	Payment should be successful
9	Confirm order	Order/Restaurant System	Restaurant should receive the order
10	Track order	Order/Delivery Tracking System	Order status should update correctly
11	Receive food	Delivery System	Order should be delivered successfully

Expected End Result: The complete flow from restaurant selection to food delivery should work correctly, with all connected systems exchanging the required information.

3. Write an end-to-end workflow test for a Flipkart-style shopping journey: user logs in, searches for a product, adds it to the cart, applies a discount coupon, selects an address, and completes the purchase.
Hint: Include both positive and one negative scenario (e.g., invalid coupon or out-of-stock item).

End-to-End Workflow – Flipkart-Style Shopping

Scenario: Verify that a user can purchase a product successfully.

Positive Scenario

Step	Test Step	Expected Result
1	Open shopping website	Home page should open
2	Log in with valid credentials	User should log in successfully
3	Search for a product	Relevant products should be displayed
4	Select an available product	Product details should be displayed
5	Click Add to Cart	Product should be added to cart
6	Open cart	Correct product and price should be displayed
7	Apply a valid coupon	Coupon should be accepted and discount applied
8	Select delivery address	Address should be selected successfully
9	Select payment method	Payment option should be available
10	Complete payment	Payment should be successful
11	Check order confirmation	Order ID and confirmation should be displayed

Expected Result: Product should be purchased successfully and an order confirmation should be generated.

Negative Scenario – Invalid Coupon

Step	Test Step	Expected Result
-------------	------------------	------------------------

1	Log in	Login should be successful
2	Search and select a product	Product should be available
3	Add product to cart	Product should appear in cart
4	Enter an invalid/expired coupon	Coupon should be rejected
5	Check cart total	No invalid discount should be applied
6	Continue with purchase	User should be able to continue without the invalid coupon

Expected Result: Invalid coupon should not be applied, and the system should display a suitable error message.

4. List all the system integrations involved in a Paytm mobile recharge flow (user login, plan selection, payment, SMS confirmation), and write one test case for each integration point.

Paytm Mobile Recharge – System Integrations

The main integrations involved are:

1. **User Login → Authentication System**
2. **Mobile Number/Plan Selection → Recharge/Operator System**
3. **Payment → Payment Gateway/Bank/UPI**
4. **Recharge Confirmation → Recharge/Operator System**
5. **SMS Confirmation → SMS/Notification Service**

Test Case 1 – Login Integration

Field	Details
Test Case ID	PAY-INT-01
Test Scenario	Verify login integration
Steps	Enter valid mobile number and login/OTP
Expected Result	User should be successfully logged in

Test Case 2 – Plan Selection Integration

Field	Details
Test Case ID	PAY-INT-02
Test Scenario	Verify recharge plan integration
Steps	Enter mobile number and select operator and recharge plan
Expected Result	Correct recharge plans should be displayed

Test Case 3 – Payment Integration

Field	Details
Test Case ID	PAY-INT-03
Test Scenario	Verify payment gateway integration
Steps	Select payment method and complete payment
Expected Result	Payment should be processed successfully

Test Case 4 – Recharge Integration

Field	Details
Test Case ID	PAY-INT-04
Test Scenario	Verify successful recharge with operator
Steps	Complete payment and wait for recharge processing
Expected Result	Mobile number should be recharged with the selected plan

Test Case 5 – SMS Confirmation Integration

Field	Details
Test Case ID	PAY-INT-05
Test Scenario	Verify SMS confirmation
Steps	Complete a successful recharge
Expected Result	User should receive a recharge confirmation SMS/notification

Short Definition for Your Assignment

End-to-End Testing: Testing the complete application workflow from the beginning to the final result.

System Integration Testing: Testing whether different systems, modules, APIs, and external services work correctly together.

Example: In a food-ordering app, **Login** → **Restaurant** → **Cart** → **Payment** → **Restaurant** → **Delivery Tracking** is an integrated end-to-end flow.
